

2.5 The Demographic Transition Model

Objective and Essential Learning

2.5 Explain theories of population growth & decline.

- The demographic transition model can be used to explain population change over time.
- The epidemiological transition explains causes of changing death rates.

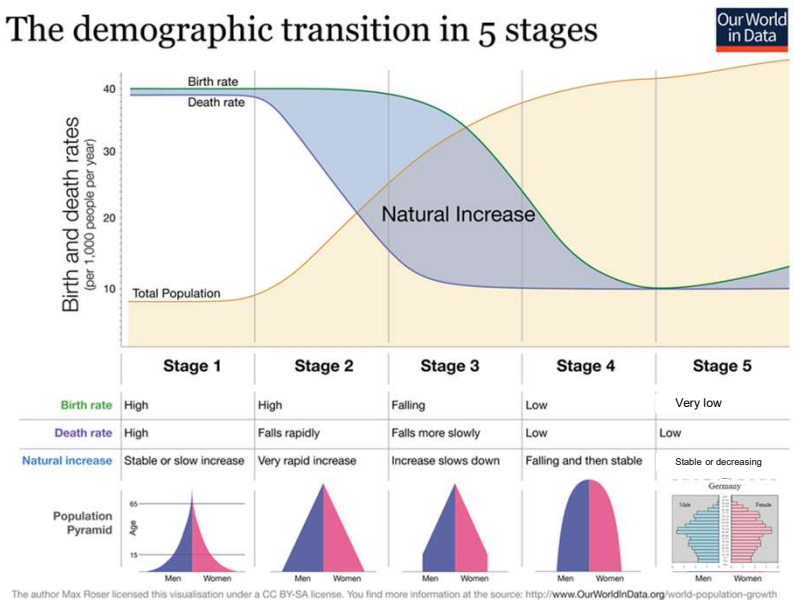

2.8 Explain how the changing role of females has demographic consequences in different parts of the world.

- Changing social values and access to education, employment, health care, and contraception have reduced fertility rates in most parts of the world.
- Changing social, economic, and political roles for females have influenced patterns of fertility, mortality...

The Demographic Transition Model

- Demography: The study of population statistics.
- Demographic Transition Model (DTM): Model used by geographers to analyze and predict trends in population growth and decline including patterns of births, deaths and natural increase rates.

The demographic transition in 5 stages

Characteristics of Stage One

Birth Rate: High
Death Rate: High
Natural Increase Rate: Low Growth

Reasons for CBR

- High TFR because children are not likely to survive long-term -> High IMR & CMR.
- Need for child labor in agricultural societies.

Characteristics of Stage One

Reasons for CDR

- Short life expectancy
- Famine, poor diet, inadequate housing, disease, warfare

Examples: No countries are in this stage.
Historic stage.

Population Composition: Youth dependency

Characteristics of Stage Two

- Birth Rate: High
- Death Rate: Falls rapidly
- Natural Increase Rate: Rapid growth

Reasons for CBR

- Remains the same as previous stage

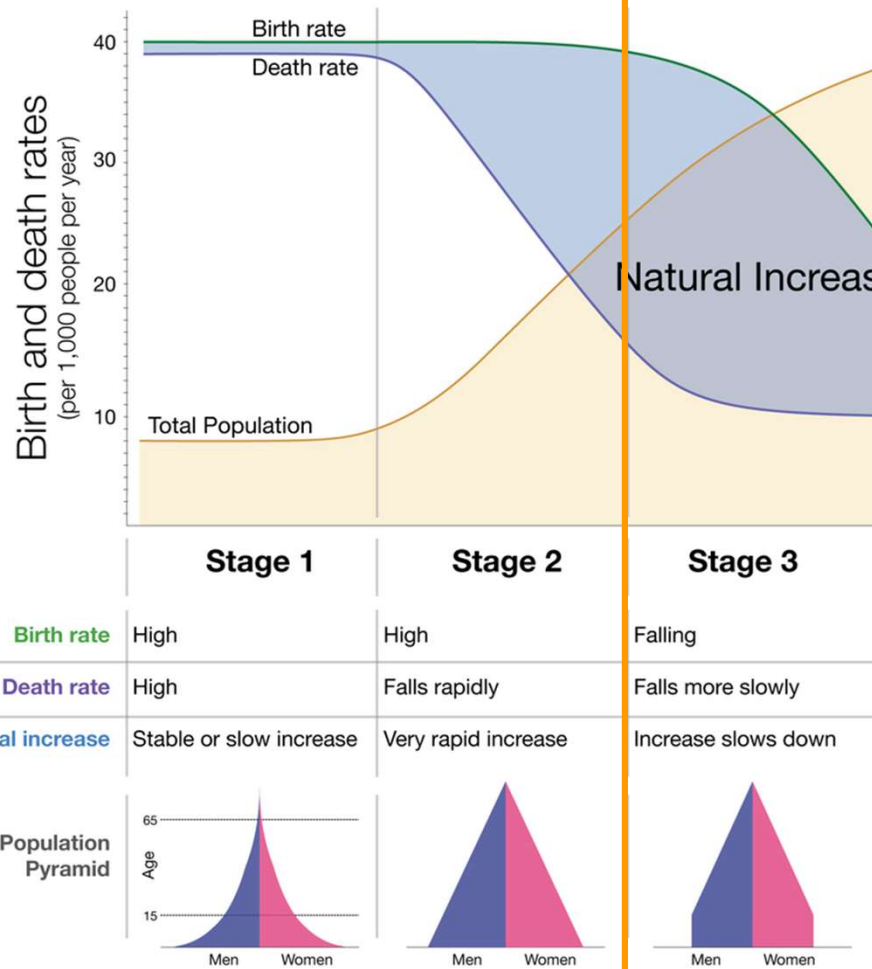

Characteristics of Stage Two

Reasons for CDR

- Still a low life expectancy, but...
- Improved nutrition, sanitation and medicines.

Examples: LDCs, Niger, Mali, South Sudan

Population Composition: Youth dependency

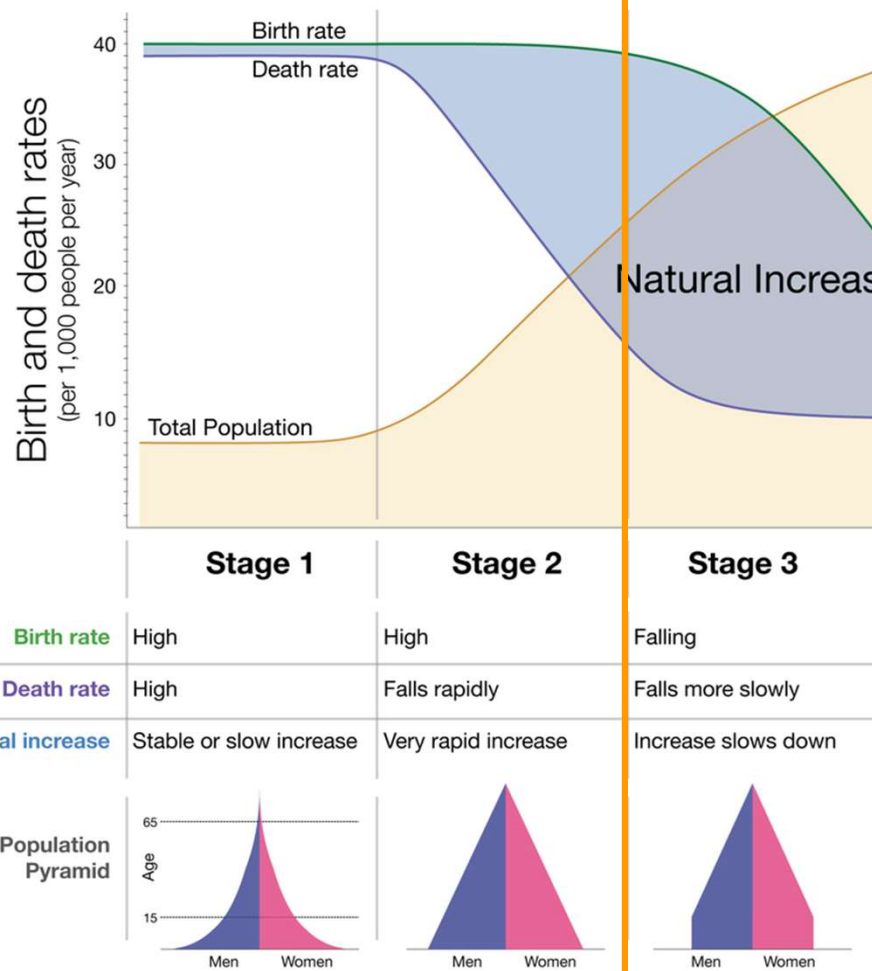

Characteristics of Stage Three

Birth Rate: Falling
 Death Rate: Falls more slowly
 Natural Increase Rate: Growth slows

Reasons for CBR

- Urbanization reduces the need for child labor - children \$\$, smaller living spaces.
- Increase in healthcare, female employment and education

Characteristics of Stage Three

Reasons for CDR

- Life expectancy increases due to the progression of advancements from previous stage.

Examples: Many Semi-Periphery countries like Turkey, Mexico, Indonesia, India

Population Composition: Society is still young, but there are more people surviving longer.

Characteristics of Stage Four

- Birth Rate: Low
- Death Rate: Low
- Natural Increase Rate: Falls and then stabilize

Reasons for CBR: Same as previous stage.

Reasons for CDR

- Life expectancy continues to increase.

Examples: Majority of MDCs- China, Australia, Canada, South Korea, US

Population Composition: Beginning to shift to elderly dependency.

<http://www.OurWorldInData.org/world-population-growth>

Characteristics of Stage Five

Birth Rate: Very low

Death Rate: Low

Natural Increase Rate: Negative or very low.

Reasons for CBR

- Zero Population Growth (ZPG)

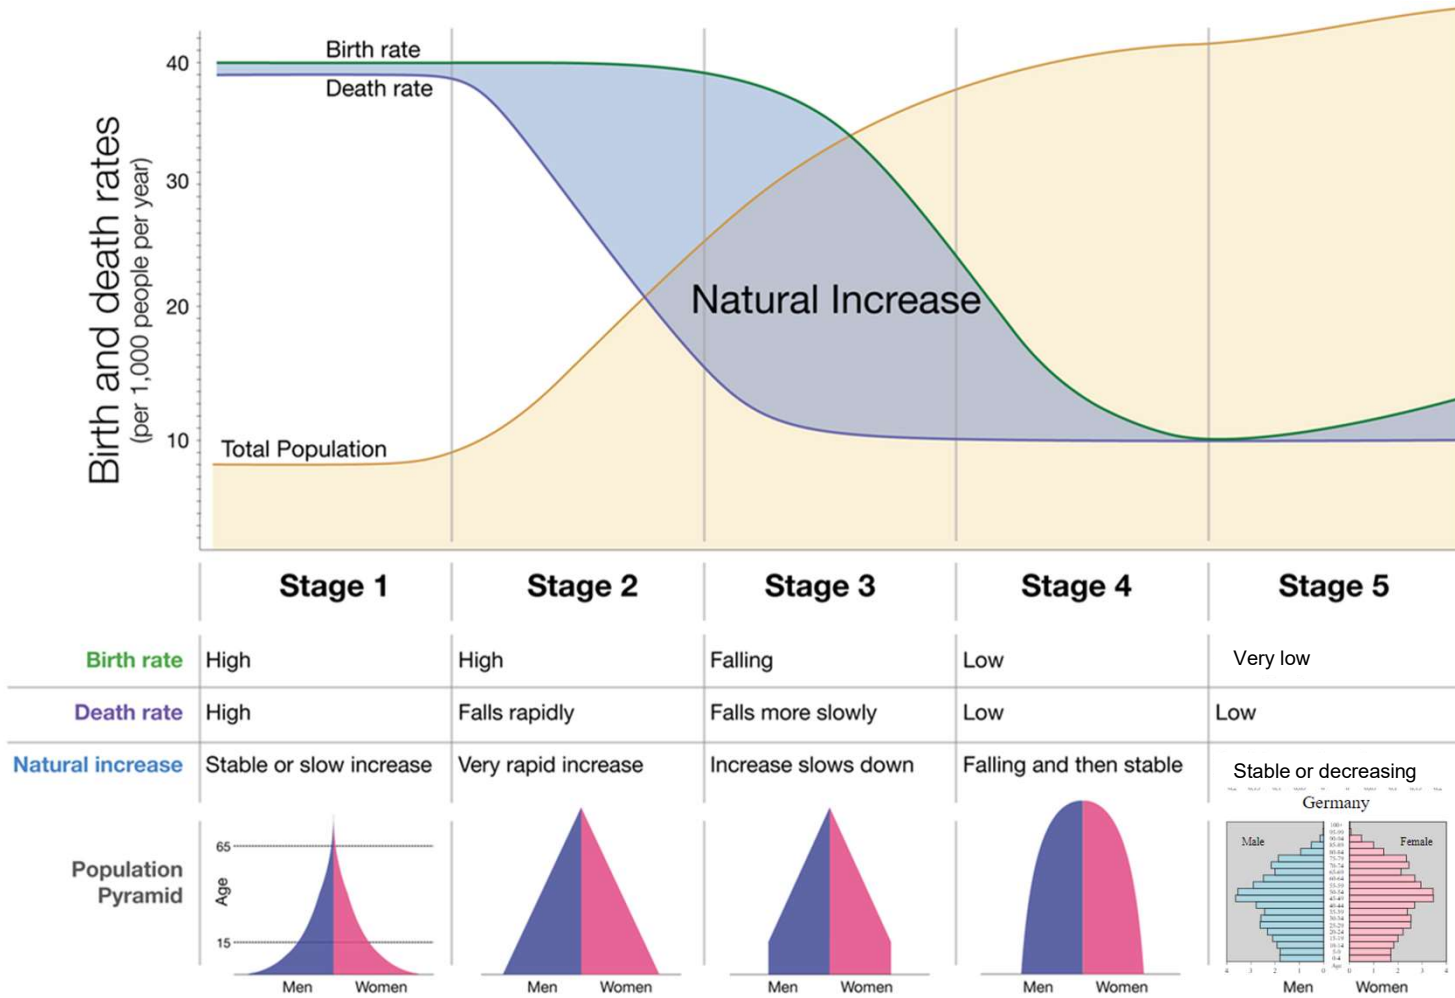

Reasons for CDR

- Most medically advanced

Examples: Japan, Germany

Population Composition: Most likely to have a high elderly dependency ratio.

Directions: For each scenario below, write what stage from the Demographic Transition Model it represents

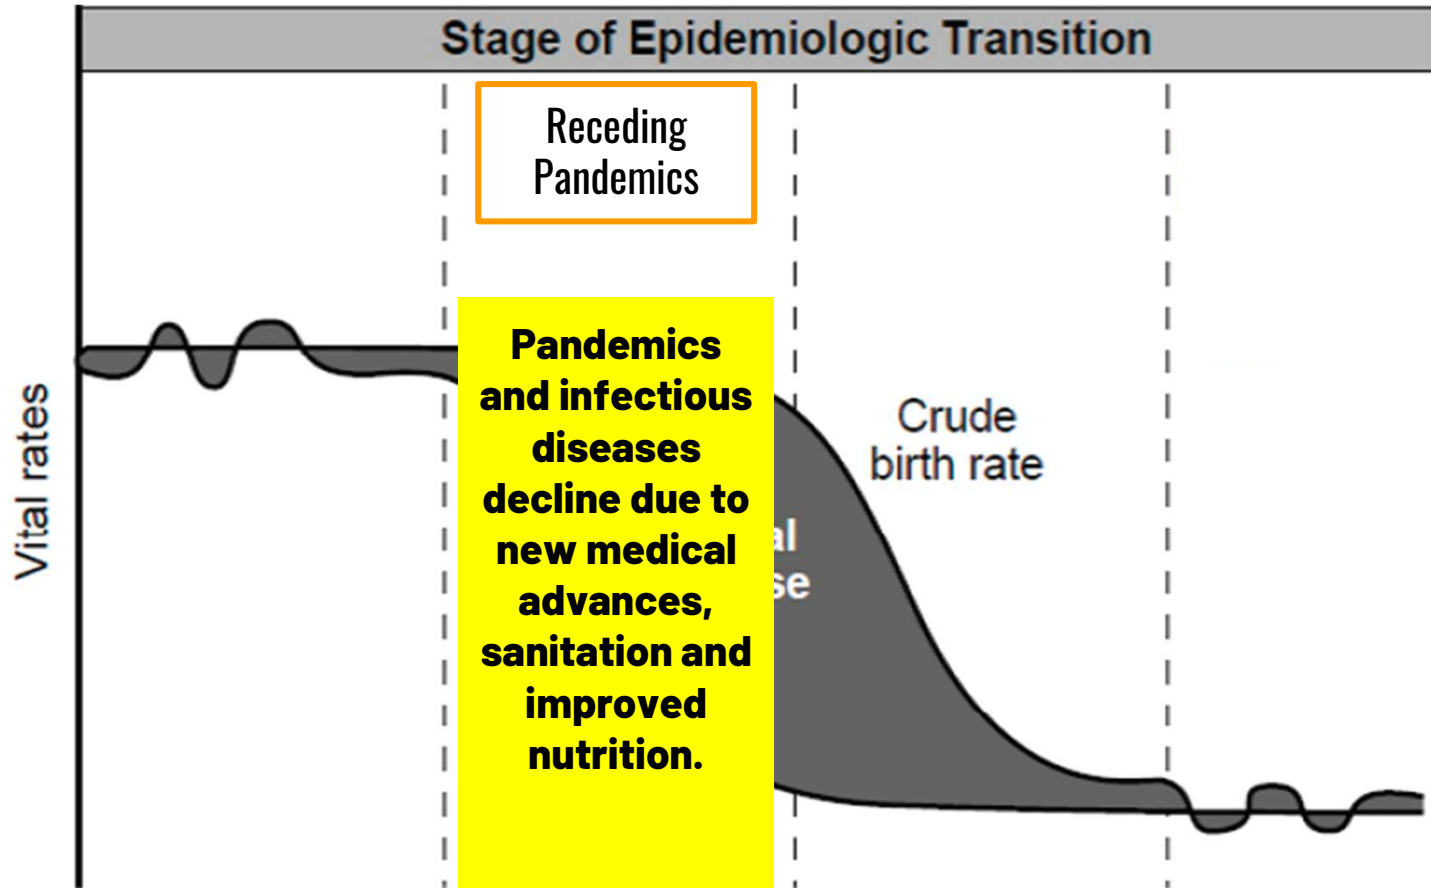

Scenario	Stage	Scenario	Stage
Billy White loses his job a grave digger		New home construction is rapidly increasing	
Parents start to think more about family planning		The public health inspector smiles as the buildings sewer system is completed	
Children are warmer in bed each night because they have more brothers and sisters		Fewer children share a bedroom	
There are more Golden (50 years) anniversaries being celebrated		Grandparents are very rare	
A mother sobs over the grave of her last six children who died because of smallpox		There are more grandparents than grandchildren	
Women begin to earn college degrees and obtain jobs		Death Rate Falling Rapidly	
Extremely Low Birth Rate, Low Death Rate		The United States	
Continued medical advancements, enhanced welfare provisions, economic independence of women, and improved access to contraceptives is seen in stage		Improved sanitation, children seen as an asset, mechanization, and population explosion are characteristics of stage	

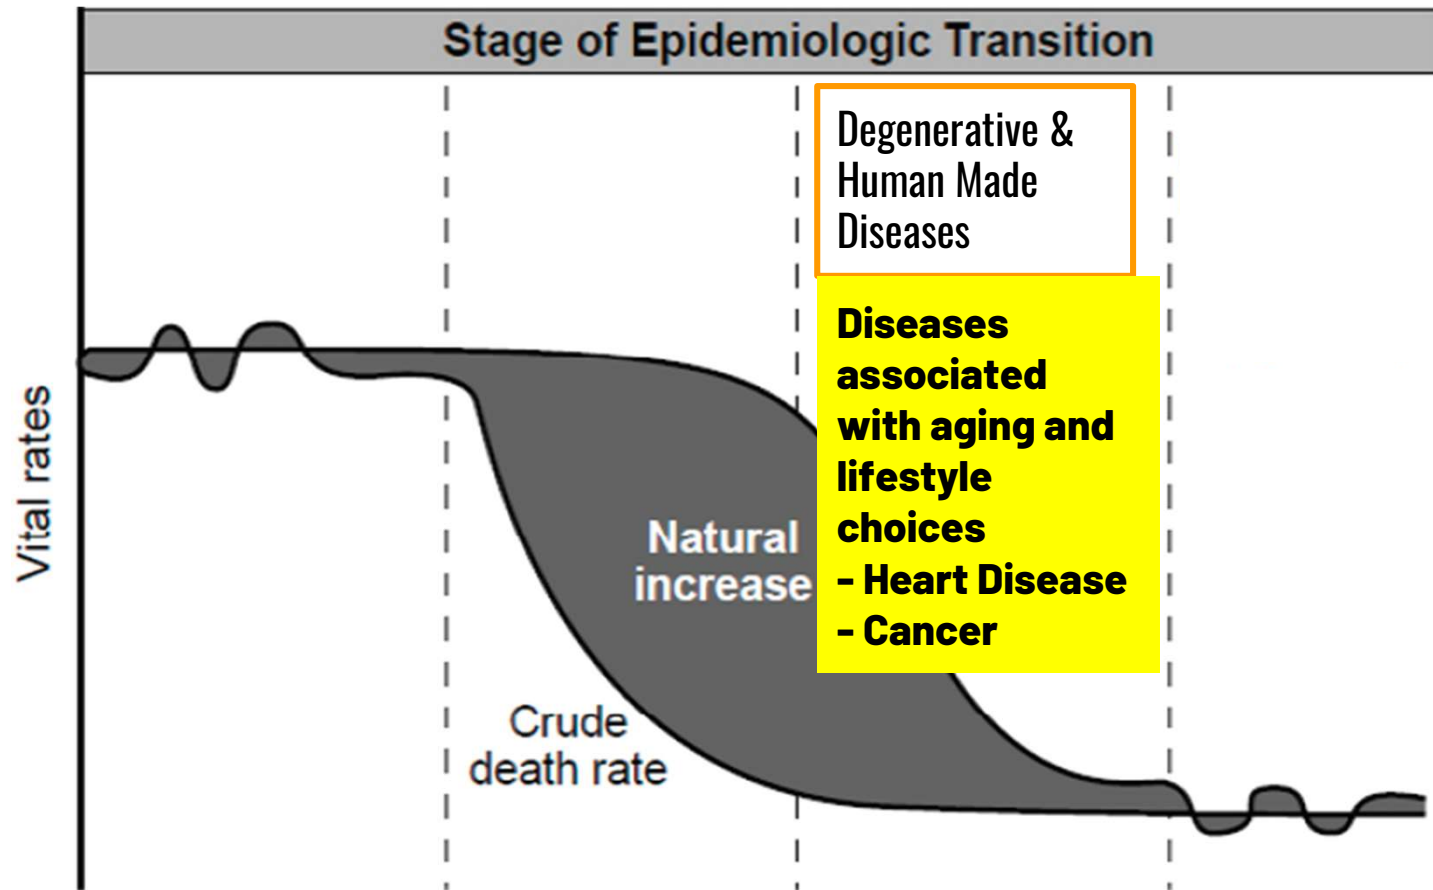

The Epidemiological Transition Model

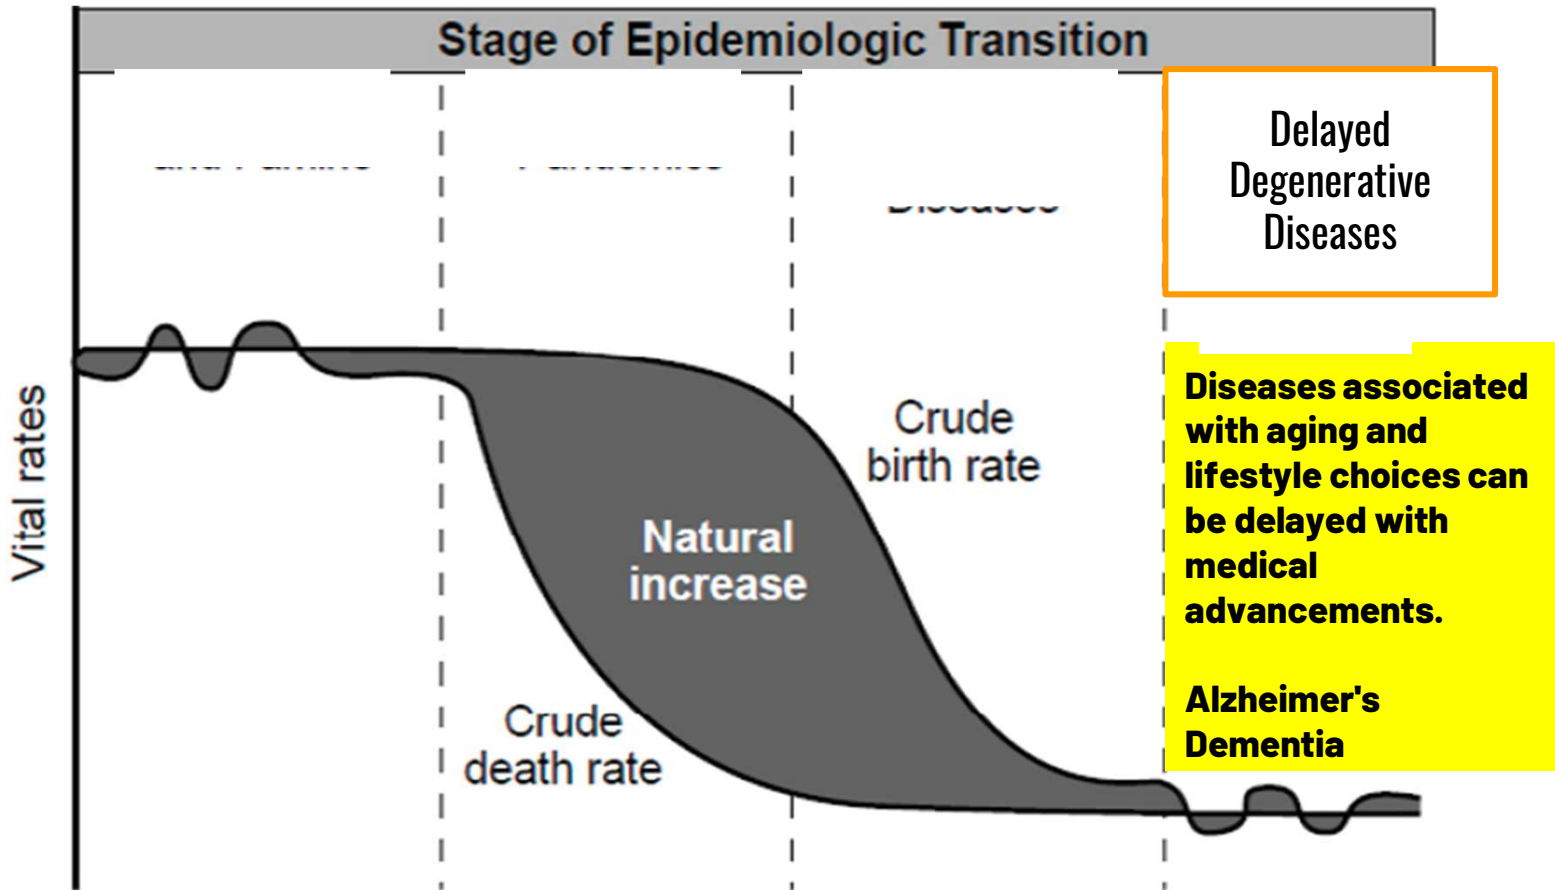

- Epidemiological Transition Model (ETM): Predictable stages in disease and life expectancy that countries experience as they develop which corresponds with the stages of the DTM.

Reemergence of Infectious Diseases

Bacteria and parasites become resistant to antibiotics and vaccines.

Reemergence of infectious diseases.

Ebola
COVID-19
